# SOPHOS UTM: WEB ADMIN ERİŞİM PROBLEMİ

If you can login as root:

To change the password for admin run

```
cc passwd mynewpassword
```

To change the WebAdmin port to 4444, run

```
cc set webadmin port 4444
```

To confirm that “Internal (Network)” is in ‘Allowed Networks’ for WebAdmin:

```
cc get webadmin allowed_networks
```

That will give you one or more REF\_ objects. One of mine is REF\_nuSwABYbAt

```
cc get_object REF_nuSwABYbAt |grep 'name
```

and that tells me: ‘name’ => ‘Internal (Network)’,

If ‘Allowed networks’ is empty, we need the REF\_ for “Internal (Network)”

```
cc get_object_by_name 'network' 'interface_network' 'Internal (Network)'
```

Once you have the REF\_, you can add it. Using mine as an example (note the extra @ and + symbols – copy, paste and enter each line separately!):

```
cc
webadmin
allowed_networks@
+REF_nuSwABYbAt
exit
```

Now, you should be able to login to WebAdmin as admin from the LAN.
